                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                  This invention describes a novel bacterial preparation (1) which comprises one or more isolated and purified strain(s) of a microorganism, contribed in tryptone yeast extract (TTE) broth, which produces one or cultured in tryptone yeast extract (TTE) broth, which produces one or more RTX toxins (belonging to the family of toxins referred to as Repeats in Toxins), where the strain(s) have at least one RTX toxin which is coll-associated. The products of the invention have immunostimulatory, antiarthritic and antiabortive activity. The bacterial preparation may be used as vaccines for the prophylaxis and treatment of infectious diseases caused by strains of microorganisms which produce one or more RTX toxins. The infectious diseases are swine pleuropneumonia, pneumonia, septicemia, nephritis and arthritis in swine; septicemia, nephritis, endocarditis and arthritis in piglets; shipping tever and abortion in cattle; whooping cough, alsepy foal disease or joint ill (purulent nephritis, and gastroenterius, fibe bacterial, preparations may also be used to prepare antibodies which may be used as a means of may also be used to prepare antibodies which may be used as a means of passive immunization. This sequence represents the Actinobacillus preparation.
                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RTX toxin; apxICA gene; apxIBD gene; apxIIAB'C gene; apxIIIABCD gene; repeat in toxins toxin; cell-associated RTX toxin; vaccine production; therapy; A. pleuropneumoniae infection; swine pleuropneumonia.

This invention describes a novel bacterial preparation (1) which comprises one or more isolated and purified strain(s) of a microorganism, cultured in tryptone yeast extract (TYP) broth, which produces one or more RTX toxins (belonging to the family of toxins referred to as Repeats in Toxins), where the strain(s) have at least one RTX toxin which is cell-associated. The products of the invention have immunostimulatory, antimurication land antiabortive activity, antimicrobial, antiinflammatory, antiarthritic and antiabortive activity.

The bacterial preparation may be used as vaccines for the prophylaxis and control in frectious diseases caused by strains of microorganisms which produce one or more RTX toxins. The infections diseases are swine pleuropneumonia, pneumonia, septicemia, nephritis and arthritis in piglets; shipping fever and abortion in cattle; whooping cough, sleepy foal disease or joint ill (purulent nephritis, arthritis) in foals; septicemia, pepticinis, and gastroomteritis. The bacterial preparations may also be used to prepare antibodies which may be used as a means of passive immunization. This sequence represents the Actinobacique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pleuropneumoniae apxIA protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A vaccine contg. a product of the LhaA gene as the active ingredient - for prophylaxis of Actinobacillus (Haemophilus) pleuropneumoniae infectious diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is Pasteurella (Mannheimia) haemolytica modified leukotoxin-50 (lkt50) protein. The modification comprises the removal of amino acids within the hydrophobic transmembrane domain of a full length leukotoxin protein. Modified leukotoxin sequences are used in vaccines to treat or prevent diseases associated with leukotoxin, e.g., respiratory disease, and Mannheimia infection (particularly M. haemolytica infection). In addition, the vaccine is used to prepare a medicament. Furthermore, the plant transformed with modified leukotoxin sequences is fed to an animal such as a ruminant, to prevent or treat respiratory diseases.

It is the product of a chimeric gene (AAT37177) produced by deleting an approx. 1300 bp sequence from pCB113 (see also AAT37176) coding for amino acids 352-784 of LKT-352. Recombinant plasmid pCB111 (LKT 111:4 copy GnRH, ATC 6948) was obtd. Escherichia coli transformants produced the chimeric protein, which is useful as a vaccine for fertility control, esp. immunological sterilisation of domestic or farm

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides myostatin peptides consisting of 3-100 amino acids, derived from a region of mouse, rabbit, human, baboon, bovine, cacids, christ, turkey or zebrafish myostatin (see sequences AAY33930-939). The myostatin peptides are derived preferably from a region of amino acid residues 1-275, 25-300, 50-325 or 75-350 of the above sequences. The peptides and the nucleic acids encoding the peptides are useful as vaccines for eliciting an immune response in a vertebrate against a myostatin immunogen. They result in increasing body weight.

Wuscle mass, number and size of muscle cells, muscle strength, mammary gland tissue, lactation, appetite or feed uptake, life span of the vertebrate, and cause a reduction in body fat content, useful for muscle wasting conditions. The vaccines are also useful for treating a disorder which comprises degeneration or wasting of muscle in a vertebrate, and cuseful for modulating GDF11 activity. The present sequence represents a leukotoxin carrier protein (LKT 14) which is used as an immunological carrier protein to form a myostatin immunoconjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                       The present sequence represents the LKT-GnRH chimeric protein from pCB111. This plasmid contains the LKT 111 polypeptide fused to four copies of the GnRH peptide. This chimera lacks cytotoxic activity which enables there to be an increase in antigen presentation and thus an optimal immune response. The removal of this region also enables the truncated LKT to be expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a leukotoxin polypeptide, several multimers, and a GnRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of mammanry tumours in a mammalian individual.
                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Modified leukotoxin polypeptide is useful in a vaccine to prevent or treat Mannheimia (Pasteurella) infection (particularly M. haemolytica infection), and disease associated with a leukotoxin, e.g., respiratory
                                                                                                                                                                                                                                                           The present sequence is Pasteurella (Mannheimia) haemolytica modified leukotoxin-66 (lkt66) protein. The modification comprises the removal of amino acids within the hydrophobic transmembrane domain of a full length leukotoxin protein. Modified leukotoxin sequences are used in vaccines to treat or prevent diseases associated with leukotoxin, e.g., respiratory disease, and Mannheimia infection (particularly M. haemolytica infection). In addition, the vaccine is used to prepare a medicament. Furthermore, the plant transformed with modified leukotoxin sequences is fed to an animal such as a ruminant, to prevent or treat respiratory diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a fusion protein comprising gonadotropin-
releasing hormone (GRRH) immunogens and a Pasteurella
haemolytica leukotoxin (LKT) protein. The fusion protein comprises, in
the N to C-terminal direction, a synthetic peptide sequence (AAY58364),
an eight copy GRRH multimer (composed of two copies of the 4xGRRH
autliner sequence of AAY58363), the LKT protein (Which functions as a
carrier protein), and a second eight copy GRRH multimer. The fusion
protein may be used in a vaccine composition for prepubertal
administration to a vertebrate subject to result in prolonged suppression
of reproductive behaviour and/or fertility. GRRH immunospens, analogues or
antibodies that cross-react with endogenous GRRH of a vertebrate subject
are used to manufacture a composition or vaccine for immunosterilisation
The present sequence represents the LKT-GnRH chimeric protein from pCB122. This plasmid contains the LKT 111 polypeptide fused to sixteen copies of the GnRH peptide, in the pattern of: 8 copies of GnRH-LKT 111-8 copies of GnRH-LKT 111-8 copies of GnRH-LKT 111-8 copies of GnRH-LKT 111-8 immered of GnRH increase in antigen presentation and thus an optimal immune response. The removal of this region also enables the truncated into the expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a leukokoxin polypeptide, several multimers, and a GnRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Leukotoxin; gonadotropin-releasing hormone; GnRH; immunosterilisation;
                                                                                                                                                                                                                                                                                                          Gaps

This sequence represents a chimeric gonadotropin releasing

hormone (GnRH)-leukotoxin (LKT) fusion protein, which may be

used as a vaccine. The LKT portion of the protein acts to enhance

the immunogenicity of the multimeric GnRH portion (AAYSB135). The

invention relates to a method of using two GnRH immunogen vaccines to

produce uncastrated male animals for meat production, one vaccination

prior to or during the fattening period to reduce circulating

testosterone levels, and the second vaccination about 2-8 weeks before

catosterone levels, and the second vaccination about 2-8 weeks before

catosterone levels, and the second vaccination about 2-8 weeks before

catosterone levels and the second vaccination about 2-8 weeks before

catosterone levels and the second vaccination to the non-androgenic

stanght gain and muscle/fat distribution of male animals without the

problems associated with male animals. Such problems include "boar

problems associated with male animals. Such problems include "boar

cating," a winnel-like adour found in cooked meat of uncastrated pigs which

is caused by steroids stored in the tissues, and similar flavour

impairments in the meat of other intact male animals. The invention is
                                                                                                                                                                                                                                                                      ö
               The vaccines are used to suppress reproductive behaviour and/or fertility for at least 10 months. The prepubertal administration results in a prolonged, long-term suppression of testicular development and/or function in males, or a prolonged, long-term suppression of ovarian development and/or function in females. The methods provide a viable and desirable alternative to surgical forms of sterilisation that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gonadotropin releasing hormone; GnRH; leukotoxin; LKT; fusion protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Plasmid pAA352 is derived from pAA114, a clone isolated from a genomic library of P. haemolypica. The protein, designated "new leukotoxin" or "LKT 352" is 98% homologous to authentic leukotoxin. LKT 352 and pref. antigenic fragments of it, can be used in vaccines to protect cattle from respiratory diseases. They can also be used to produce antibodies for immnoaffinity purificn. of further proteins. [Fig. contg. sequence v. poor]. see also AAR10890, AAR10910 and AAQ10783.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pasteurella haemolytica proteins and genes - used for producing vaccines to protect animals esp. cattle from respiratory diseases e.g. pneumonia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Haemophilus somnus; immunogenic; haemolysin; LppB; LppC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAR42385
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidaes, therapeuticia and pharmaceutical furge. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ABBS7737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

```
The hmb gene encoding the haemin-binding protein was expressed in B. coll as a fusion to the Pasteurella haemolytica leukotoxin gene lkt coded for by plasmid pA352. The hmb gene fragment was taken from pRAP504 and starts at the codon for the 33 rd amino acid residue of ORFI. The haemin binding protein can be used in vaccines for preventing or treating H. somunus infections, which cause thromboembolic meningo-encephalitis, septicaemia, arthritis and pneumonia in
                                                                                                                                                                                                                                                                                         Haemophilus somnus immunogenic proteins used in vaccines - selected from haemin-binding protein, haemolysin, LppB and LppC,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Haemophilus somnus; immunogenic; haemolysin; LppB; LppC; thromboembolic meningoencephalitis; septicaemia; arthritis; pneumonia; lktA gene; haemin-binding protein; fusion protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The lppB gene protein was expressed in E. coli as a fusion to the Pasteurella haemolytica leukotcoxin gene lktA coded for by plasmid pAA352. The llpB gene fragment was taken from pMS11. LppB can be used in vaccines for preventing or treating H. sommus infections, which cause thromboembolic meningo-encephalitis, septicaemia, arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Haemophilus somnus immunogenic proteins used in vaccines - selected from haemin-binding protein, haemolysin, LppB and LppC, and corresp. The LKT352 gene was prepd. as follows: lktA, an MaeI fragment contg. the gene was ligated into the SmaI site of pUC13 to form pAA179. From this, two constructs were made in the ptac-based vector, pGH432:lacI digested with SmaI. One, pAA342, consisted of the 5' AhaIII fragment from lktA while the other, pAA345, contained

in lambda gtil and pucil. Resulting clones were used to transform E. coli and individual colonies were pooled and screened for reaction with serum from a calf which had survived a P. haemolytica infection and that had been boosted with a conc. culture supernatant of P. haemolytica to increase anti-leukotoxin antibody levels. Positive colonies were screened for their ability to produce leukotoxin by incubating cell lysates with bovine neutrophils and measuring the release of lactate dehydrogenase from the neutrophils. A 4kb fragment was obtd. Progressively larger clones were isolated by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
the entire Mael fragment. Clone pAA342 expressed a truncated leukotoxin peptide at high levels while pAA345 expressed full length leukotoxin at very low levels. The 3' end of the lkth gene of pAA345 was therefore ligated to Styl/BamHi digested pAA342 to yield pAA352 contg. the LKT352 sequence. The protein expressed from the vector can be used to prepare a subunit vaccine with other P. haemolytica antigens, e.g. fimbrial protein, plasmin receptor or 50K outer membrane protein. The vaccines can be used to protect cattle from respiratory diseases such as pneumonia, esp.

chromosome walking to isolate full length recombinants of ca. 8kb, in pAA114. The clone was subjected to restriction enzyme digestion to yield two clones, one expressing truncated leukotoxin peptide at high levels and the other expressing the full length leukotoxin at low levels. The 3' end of the lkth gene from the full length clone was ligated to the truncated gene clone to yield plasmid pAA352. The clone was used to produce chimeric proteins by gene fusion with an clone was used to produce chimeric proteins by gene foamtostatin, gonadotrophin releasing hormone or rotaving viral protein 4, i.e. leukotoxin works as a carrier protein to bring about a larger immune response than the antigen alone. Immunisation with these antigens can regulate growth rate, lactation and reproductive efficiency. See also AAR14546-8. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A truncated leukotoxin (AAW03945), LKT 352, lacks the cytotoxic portion of the native protein from Pasteurella haemolytica. It is the product of plasmid pAA352 which carries a truncated lktA gene (AAT37179). A fusion protein (AAW03942) between LKT352 and a gonadotropin releasing hormone terramer can be expressed in Escherichia coli. This is useful as a vaccine for fertility control, partic. immunological sterilisation of domestic or
length leukotoxin at very low levels. Therefore, the 3' end of the lktA gene was ligated into pAA342, yielding plasmid pAA352.
LKT352 or new leukotoxin is 98% homologous to authentic
                                                                                                                                                                                                                                                                                                                          ;

This gene produces a truncated protein that has an estimated molecular weight of about 99 kDa and lacks the cytotoxic portion of the molecule. Thus this gene has a higher expression level than that of the full-length molecule. This can be used in the construction of a chimeric protein that comprises a leukotoxin polypeptide, several multimers, and a GnRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of mammary tumours in a mammalian individual.
                                                                                                                                       Gonadotropin releasing hormone; GnHR; chimera; leukotoxin polypeptide; multimer; vaccine; tumour; Leukotoxin 352; LKT 352; lktA; plasmid pAA352;

Leukotoxin genes from Pasteurella suis - also vectors and cells for expressing gene prods., for use in vaccines against porcine enteritis
                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is protein prod. of the Pasteurella suis leukotoxin gene pslkta, which together with the pslktc, and pslktb gene prods., comprises a high mol. wt. calcium dependent cytotoxic protein of the repeat of toxin family (RTX), capable of killing both BL-3 cells and pig lymphocytes. The leukotoxin proteins, and the pslktc, A and B genes, or fragments, can be used as immunogens in vaccines for the immunisation of pigs against diarrhoes, or as reagents in diagnostic assays. The leukotoxin genes were isolated by screening a P. suis genomic library, in the phage vector lambda-dash, with a DNA probe derived from PYFC19.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              carrying the IKtCA locus (Chang et al., Infect. Immun., Vol. 55, pp2248-2254, 1987).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (Updated on 25-MAR-2003 to correct PF field.)

Oligonucleotides contg. sequences from bovine somatostatin (SRIF) gene were constructed on a Pharmacia Gene Assembler using standard phosporamidite chemistry. The oligonucleotides were annealed and ligated into vector pAA352 (contg. the Pateurella heamolytica leukotoxin gene) which had been digested with BamHi. The ligated DNA was used to transform E. coli strain JM105. Transformants contg. the oligonucleotide inserts were identified by restiction endonuclease mapping and the recombinant plasmid designated pAA496. The chimeric protein produced from the plasmid works to bring about a larger immune response than the antigen alone, i.e. the leukotoxin works as a carrier protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotides contg. sequences from bovine gonadotrophin releasing hormone (GnEH) gene were constructed on a Pharmacia Gene Assembler using standard phosporamidite chemistry. The oligonucleotides were annealed and ligated into vector pAA352 (contg. the Pateurella heamolytica leuko-toxin gene) which had been digested with BamHI. The ligated DNA was used to transform E. coli strain MH3000. Transformants contg. the oligonucleotide inserts were identified by restiction endonuclease mapping and the recombinant plasmid designated phA5502. The chimeric protein produced from the plasmid works to bring about a larger immune response than the antigen alone, i.e. the leukotoxin works as a carrier protein.

The oligonucleotides were annealed and ligated into vector pAA352 (contg. the Pateurella heamolytica leuko-toxin gene) which had been digested with BamHI. The ligated DNA was used to transform E. coli strain MH3000. Transformants contg. the oligonucleotide inserts were identified by restiction endonuclease mapping and the recombinant plasmid designated pAA501. The chimeric protein produced from the plasmid works to bring about a larger immune response than the antigen some, i.e. the leukotoxin works as a carrier protein.

This protein is a 105 kD antigen which may be used in vaccines to protect cattle against shipping fever. The antigen is also useful for raising antisera which can be used for passive immunisation (for treatment or temporary prophylaxis) and also to raise antibodies which can be used in immunoassay methods for the detection of Pasteurella haemolytica antigens in biological fluids. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The leukotoxin has cytotoxic activity specific against leukocytes. The protein is used to prepare vaccines or to raise antibodies against P. haemolytica to protect cattle from pneumonic pasteurellosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
A chimeric protein (AAW03942) is composed of a fusion between a truncated leukotoxin (LKT-352) from Pasteurella haemolytica (see also AAW03945) and a 4-copy gonadoliberin-releasing hormone (GnRH) repeat sequence (see also AAW03944). It is the product of a chimeric gene (AAT37176) produced by ligating a synthetic sequence for the 4-copy GnRH into vector PAA52 (ArCC 68283), which carries the LKT-352 gene. Recombinant plasmid pCBH13 (LKT 352.4 copy produced the chimeric protein, which is useful as a vaccine for demestic or farm animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gonadotropin-releasing hormone multimer fusion proteins - with leukotoxin polypeptide for increased immunogenicity, useful in antifertility vaccine prodn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1.1%; Score 10; DB 17; Length 977;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is Pasteurella (Mannheimia) haemolytica full length leukotoxin protein. The present invention relates to modified leukotoxin DNA sequences, wherein the modification comprises the removal of DNA sequence encoding the amino acids within the hydrophobic transmembrane domain of a full length leukotoxin protein. Modified leukotoxin sequences are used in vaccines to treat or prevent diseases associated with leukotoxin, e.g., respiratory disease, and Mannheimia infection (particularly M. haemolytica infection). In addition, the vaccine is used to prepare a medicament. Purthermore, the plant transformed with modified leukotoxin sequences is fed to an animal

The present sequence represents the LKT-GRRH chimeric protein from pCB113. This plasmid contains the LKT 352 polypeptide (AAW79568) fused to four copies of the GRRH peptide. This chimera lacks cytocoxic activity which enables there to be an increase in antigen presentation and thus an optimal immune response. The removal of this region also enables the truncated LKT to be expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a leukotoxin polypeptide, several multimers, and a GRRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of mammary tumours in a mammalian individual.

Burrows L.L., Olah-Minfield B., Lo R.Y.C.;
Molecular analysis of the leukotoxin determinants from Pasteurella haemolytica serotypes 1 to 16.";
Infect. Immun. 61:5001-5007(1993).
-!- FUNCTION: Bacterial hemolysins are exotoxins that attack blood cell membranes and cause cell rupture by mechanisms not clearly DEFINED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBCELLULAR LOCATION: Secreted.

DOMAIN: The Gly-rich region is probably involved in binding calcium, which is required for target cell-binding or cytolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  activity.
--- DOMAIN: The three transmembrane domains are believed to be involved in pore formation by the cytotoxin (BY SIMILARITY).
--- PTM: Palmitoylated by lktC. The toxin only becomes active when modified (By similarity).
--- SIMILARITY: BELONGS TO THE RTX PROKARYOTIC TOXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gammaproteobacteria; Pasteurellales;

"Molecular characterization of a leukotoxin gene from a Pasteurella
haemolytica-like organism, encoding a new member of the RTX toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       is not hemolytic.
--- SUBCELLIAR LOCATION: Secreted.
--- DOMAIN: The Gly-rich region is probably involved in binding calcium, which is required for target cell-binding or cytolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    activity.
-!- DOMAIN: The three transmembrane domains are believed to be involved in pore formation by the cytotoxin (By similarity).
-!- PTM: Palmitoylated by thtC. The toxin only becomes active when modified (By similarity).
-!- SIMILARITY: BELONGS TO THE RTX PROKARYOTIC TOXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pasteurella haemolytica-like sp.                                                                                                                                                                                                                                                -!- SUBCELLULAR LOCATION: Secreted.
-!- DOMAIN: The Gly-rich region is probably involved in binding calcium, which is required for target cell-binding or cytolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                activity.
--- DOMAIN: The three transmembrane domains are believed to be involved in pore formation by the cytotoxin (BY SIMILARITY).
--- PIM: Palmitoylated by lktC. The toxin only becomes active when modified (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       44;

POTENTIAL. POTENTIAL. POTENTIAL

S.

FUNCTION: Bacterial hemolysins are exotoxins that attack blood call membranes and cause cell rupture by mechanisms not clearly

defined

SUBCELLULAR LOCATION: Secreted. DOMAIN: The Gly-rich region is probably involved in binding calcium, which is required for target cell-binding or cytolytic

activity.

DOMAIN: The three transmembrane domains are believed to be involved in pore formation by the cytotoxin (BY SIMILARITY).

PTM: Palmitoylated by lktC. The toxin only becomes active when MODIFIED (BY SIMILARITY).

SIMILARITY: BELONGS TO THE RIX PROKARYOTIC TOXIN FAMILY.

T "Cloning and characterization of the Actinobacillus

T pleuropneumoniae-RTX-toxin III (ApxIII) gene.";

Infect. Immun. 61:947-954(1993).

-1- FUNCTION: Does not have hemolytic activity but shows a strong cytotoxicity towards alveolar macrophages and neutrophils.

-1- FUNCTION: Does not have hemolytic activity but shows a strong cytotoxicity towards alveolar macrophages and neutrophils.

-1- FUNCTION: The Gly-rich region is probably involved in binding calcium, which is required for target cell-binding or cytolytic activity (By similarity).

-1- DOMAIN: The three transmembrane domains are believed to be involved in pore formation by the cytotoxin (By similarity).

-!-DOMAIN: The three transmembrane domains are believed to be involved in pore formation by the cytotoxin (By similarity).
-!- PTM: PALMITOYLATED BY APXIC. The toxin only becomes active when modified (By similarity).
-!- MISCELLANEOUS: APXIA is partially deleted in serotypes 2, 4, 6, 8, 12, and totally deleted in serotype 3.
-!- MISCELLANEOUS: The sequence shown is that of serotype 10.
-!- SIMILARITY: BELONGS TO THE RTX PROKARYOTIC TOXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBCELLULAR LOCATION: Secreted.

DOMAIN: The Gly-rich region is probably involved in binding
calcium, which is required for target cell-binding or cytolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            STRAIN=13039 / Serotype 10;

                      SEQUENCE FROM N.A.
STRAINES 4014 / Serotype 1;
Chang Y., Wang Y., Chin N.;
Submitted (JAN-1994) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: One of the virtulence factors of A.pleuropneumoniae,
which has a strong hemolytic activity and is cytotoxic for
alveolar macrophages and neutrophils.
-!- SUBCELLIARA LOCATION: Secreted.
-!- SUBCELLIARA LOCATION: Secreted.
-!- DOMAIN: The Gly-rich region is probably involved in binding
calcium, which is required for target cell-binding or cytolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4
                                                                                                                                         activity.
DOMAIN: The three transmembrane domains are believed to be involved in pore formation by the cytotoxin (By similarity).
PTM: Palmitoylated by apxIC. The toxin only becomes active when
                                                                                                                                                                                     modified (By similarity).

MISCELLANEOUS: ApxIA is partially deleted in serotypes 2, 4, 8, 12, and totally deleted in serotype 3.

MISCELLANEOUS: The sequence shown is that of serotype 1.
SIMILARITY: BELONGS TO THE RIX PROKARYOTIC TOXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3 AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             37.1%; Score 1723; DB 1; Length 1023; 39.7%; Pred. FUNCTION: One of the virulence factors of A.actinomycetemcomitans might be a cytotoxin, possibly the membrane-bound hemolysin.
SUBCELLULAR LOCATION: Outer-membrane associated or secreted (By
                                                                                                                                                                                                                                                                                                                         modified (By similarity).

MSCELLANDEOUS: Its target cell specificity is restricted to human and some non-human cells of the monomyelocytic lineage. SIMILARITY: BELONGS TO THE RIX PROKARYOTIC TOXIN FAMILY.
                                                                                                                                                                                                                                         similarity).
DOMAIN: The Gly-rich region is probably involved in binding
calcium, which is required for target cell-binding or cytolytic
                                                                                                                                                                                                                                                                           activity.

DOMAIN: The three transmembrane domains are believed to be involved in pore formation by the cytotoxin (BY SIMILARITY).

PTM: Palmitoylated by lktC. The toxin only becomes active when

            -!- CATALYTIC ACTIVITY: ATP = 3',5'-cyclic AMP + diphosphate.
-!- ENZYME REGULATION: ACTIVATED BY HOST-CALMODULIN.
-!- SUBCELLULAR LOCATION: Secreted.
-!- DOMAIN: THE GLY-RICH REGION IS PROBABLY INVOLVED IN BINDING CALCIUM, WHICH IS REQUIRED FOR TARGET CELL-BINDING OR CYTOLYTIC ACTIVITY (BY SIMILARITY).
-!- PIM: FALMASED IN A PROCESSED FORM.
-!- PIM: PALMITOYLATED IN PROCESSED FORM.
MODIFIED IN POSITION LYS-983.
-!- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE ADBNYLY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lyase; CAMP biosyntheeis; ATP-binding; Hemolysis; Toxin; Virulence; Whooping cough; Calcium-binding; Repeat; Lipoprotein; Palmitate.
